SECURE

1	2 ABC	3 DEF
4 GHI	5 JKL	6 MNO
7 PQRS	8 TUV	9 WXYZ
+ * #	0	< x

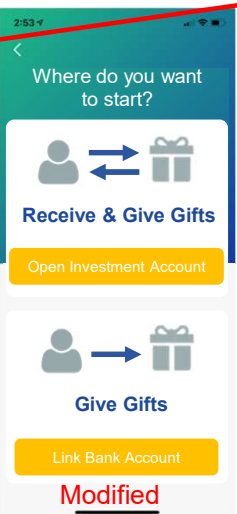

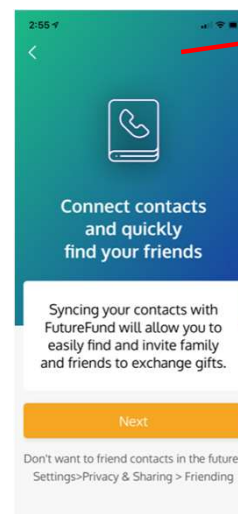

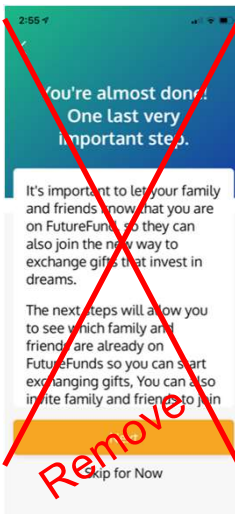

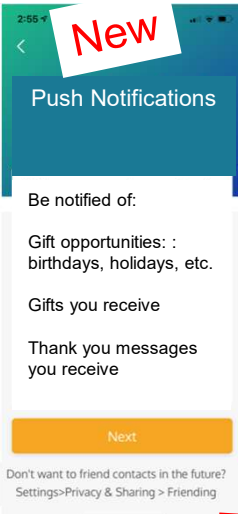

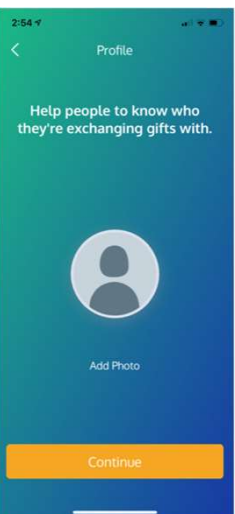

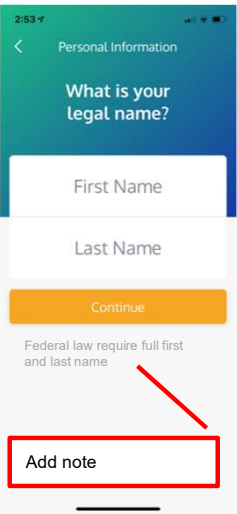

The original requirement is on the page 135

We may want to verify after the fact by sending an email and allowing them to respond to the email versus a verification code

This is where we should allow the user to use fingerprint and face ID

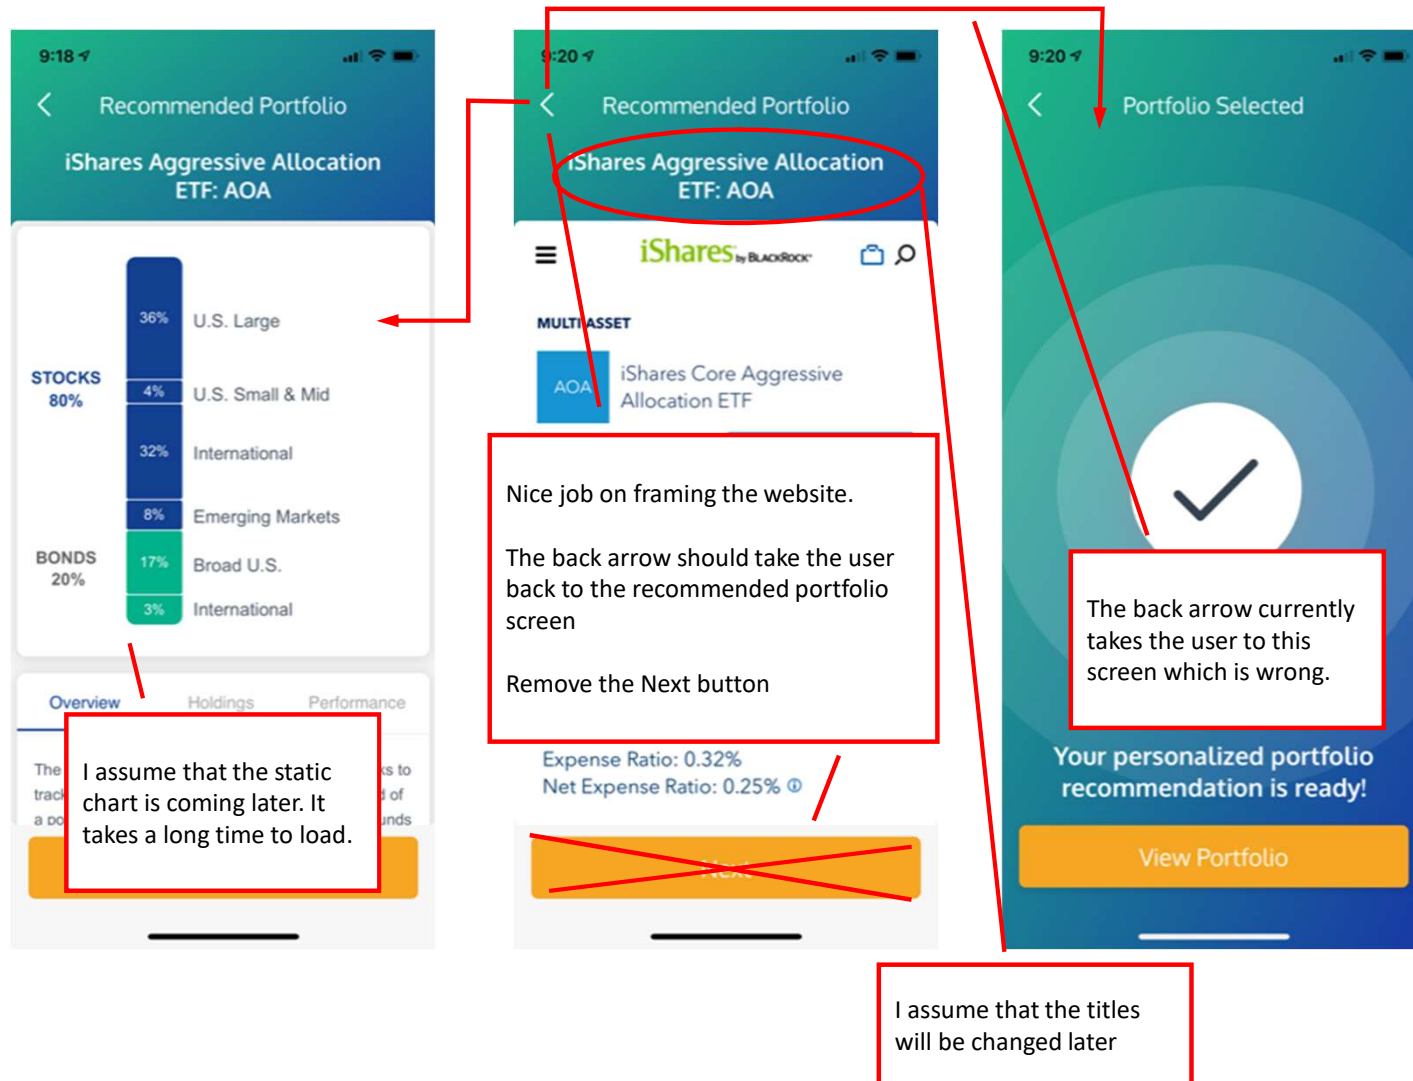

We need to ensure "contacts" and "notifications" are enabled within the onboarding process

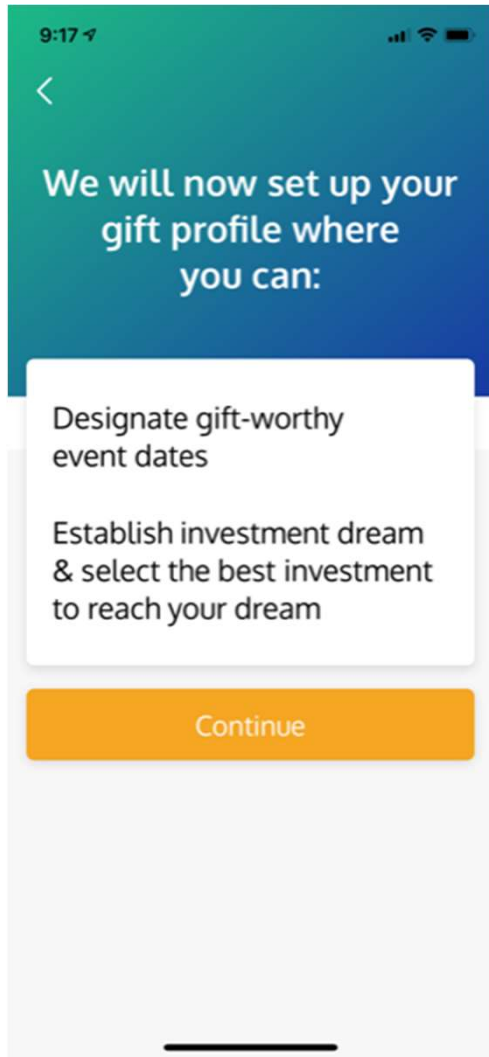

We think that it's more important to verify mobile (via text) than the user's email. We want to remove the friction of email verification.

Needed to more clearly redesign this screen due to user confusion.

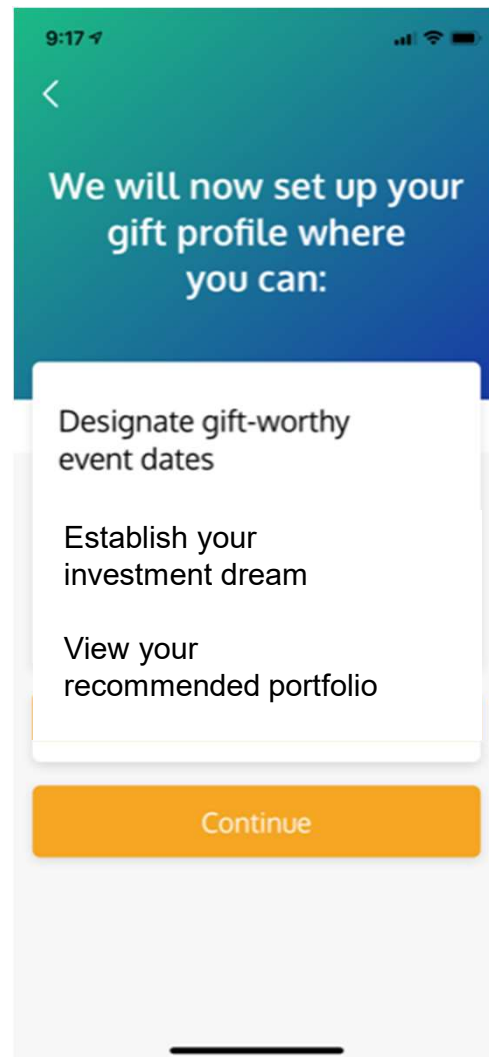

I didn't see a screen to allow for notifications. Let's add a screen like the 'Contacts' screen using negative consent.

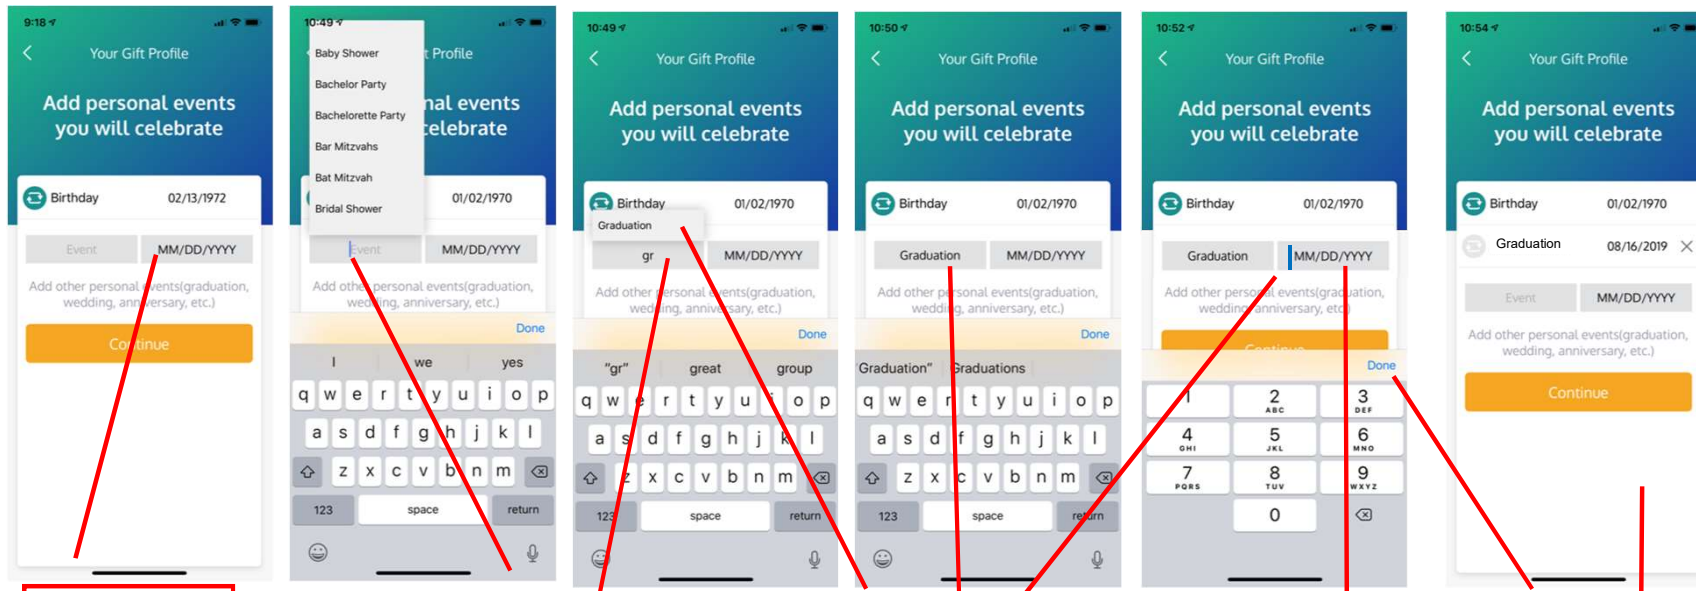

Original

Mock-up

This font should be gray until date is entered

If the user clicks on this field first, a pop-up should say: Enter an Event

This works well...the user clicks on events and starts typing until they find the event they want

Once the input is selected, the screen should automatically switch to the Date input screen and not require the user to click on it.

This screen should error any date that is prior to the current date (all dates need to be in the future)

When done is clicked the first time, the screen should revert to the "start" screen ready for another event
